A play with Rmarkdown

This is some plain text. I can make things **bold**. I can also make *things italic*.

```
# This is a code chunk  
plot(1:10)
```

R functions

In today's class, we are going to write a function together that grades some students' works.

Questions for today:

Q1. Write a function `grade()` to determine an overall grade from a vector of student homework assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an NA value) this can be used as a score to be potentially dropped. Your final function should be adequately explained with code comments and be able to work on an example class gradebook such as this one in CSV format: “<https://tinyurl.com/gradeinput>” [3pts]

```
# Example input vectors to start with
student1 <- c(100, 100, 100, 100, 100, 100, 100, 90)
student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
```

Let's start with `student1` and find their average score

```
mean(student1)
```

```
## [1] 98.75
```

But we want to drop the lowest score... We could try the **`min()`** function

```
min(student1)
```

```
## [1] 90
```

The **`which.min()`** function looks useful:

```
which.min(student1)
```

```
## [1] 8
```

Cool this gives the position of the lowest score How would I use this information?

```
#This would be the lowest score
student1[which.min(student1)]
```

```
## [1] 90
```

To drop this value, I can use minus

```
student1[-which.min(student1)]
```

```
## [1] 100 100 100 100 100 100 100
```

"Let's now use `mean()` to get the average minus the lowest score.

```
mean(student1[-which.min(student1)])
```

```
## [1] 100
```

Well this sucks! It gives NA if a student has a missing homework

```
mean(student2[-which.min(student2)])
```

```
## [1] NA
```

We need to remove the NA elements of the vector

```
mean(student2[-which.min(student2)],na.rm = TRUE)
```

```
## [1] 92.83333
```

This is not what we want. It dropped the 80 (i.e. the lowest number and not the NA i.e. missing homework)
Let's look at student3

```
student3
```

```
## [1] 90 NA NA NA NA NA NA NA
```

```
mean(student3[-which.min(student3)],na.rm = TRUE)
```

```
## [1] NaN
```

One new idea/approach is we could replace the NA(missing homeworks) with zero.
Let's try with student2.

```
student2
```

```
## [1] 100 NA 90 90 90 90 97 80
```

```
is.na(student2)
```

```
## [1] FALSE TRUE FALSE FALSE FALSE FALSE FALSE
```

This **is.na()** function returns a logical vector where TRUE elements represent where the NA values are.

```
which(is.na(student2))
```

```
## [1] 2
```

Now let's make the NA values into zeros. Simplify!!

```
student.prime <- student2  
student.prime
```

```
## [1] 100 NA 90 90 90 90 97 80
```

```
student.prime[which(is.na(student.prime))]=0
student.prime
```

```
## [1] 100  0  90  90  90  90  97  80
```

```
#or
x <- student2
student.prime <- replace(x, which(is.na(x)), 0)
```

Now we need to put this all together to get the average score, dropping the lowest score where we map NA values to zero.

```
y <- student.prime
mean(y[-which.min(y)])
```

```
## [1] 91
```

```
student.prime
```

```
## [1] 100  0  90  90  90  90  97  80
```

```
mean(c(100,90,90,90,90,97,80))
```

```
## [1] 91
```

Looks good! Now let's try with student3.

```
x <- student3
student.prime <- replace(x, which(is.na(x)), 0)
y <- student.prime
mean(y[-which.min(y)])
```

```
## [1] 12.85714
```

Now we can use this as the body of my function.

```
grade <- function(x){
  # Make sure our scores are all numbers
  x <- as.numeric(x)
  # Map NA values to zero
  student.prime <- replace(x, which(is.na(x)), 0)
  # Find the mean without the lowest value
  y <- student.prime
  mean(y[-which.min(y)])
}
```

Check

```
grade(student3)
```

```
## [1] 12.85714
```

Now read the full gradebook CSV file.

```
scores <- read.csv("https://tinyurl.com/gradeinput", row.names=1)
scores
```

```
##           hw1 hw2 hw3 hw4 hw5
## student-1 100  73 100  88  79
## student-2  85  64  78  89  78
## student-3  83  69  77 100  77
## student-4  88  NA  73 100  76
## student-5  88 100  75  86  79
## student-6  89  78 100  89  77
## student-7  89 100  74  87 100
## student-8  89 100  76  86 100
## student-9  86 100  77  88  77
## student-10 89  72  79  NA  76
## student-11 82  66  78  84 100
## student-12 100  70  75  92 100
## student-13 89 100  76 100  80
## student-14 85 100  77  89  76
## student-15 85  65  76  89  NA
## student-16 92 100  74  89  77
## student-17 88  63 100  86  78
## student-18 91  NA 100  87 100
## student-19 91  68  75  86  79
## student-20 91  68  76  88  76
```

Use for one student

```
grade(scores[10,])
```

```
## [1] 79
```

Check if NA stays the same.

```
as.numeric(c(1,2,NA,4,5))
```

```
## [1]  1  2 NA  4  5
```

GOOD! Now grade all students by using the **apply()** function

```
apply(scores,1,grade)
```

```
## student-1 student-2 student-3 student-4 student-5 student-6 student-7
##      91.75      82.50      84.25      84.25      88.25      89.00      94.00
## student-8 student-9 student-10 student-11 student-12 student-13 student-14
##      93.75      87.75      79.00      86.00      91.75      92.25      87.75
## student-15 student-16 student-17 student-18 student-19 student-20
##      78.75      89.50      88.00      94.50      82.75      82.75
```

Q2. Using your grade() function and the supplied gradebook, Who is the top scoring student overall in the gradebook? [3pts]

```
which.max(apply(scores,1,grade))
```

```
## student-18
##          18
```

GOOD JOB Student18!

Q3. From your analysis of the gradebook, which homework was toughest on students (i.e. obtained the lowest scores overall)? [2pts]

```
apply(scores,2,mean, na.rm=TRUE)
```

```
##      hw1      hw2      hw3      hw4      hw5
## 89.00000 80.88889 80.80000 89.63158 83.42105
```

```
which.min(apply(scores,2,mean, na.rm=TRUE))
```

```
## hw3
##    3
```

HW 3 was the toughest homework!

Q4. Optional Extension: From your analysis of the gradebook, which homework was most predictive of overall score (i.e. highest correlation with average grade score)? [1pt]

```
# Average grade score vector
avg.grade <- apply(scores,1,grade)
# Homework score vector
hw.score <- apply(scores,2,grade)
```
